PARTNERING FOR PROGRESS

# Need for PM Analysis

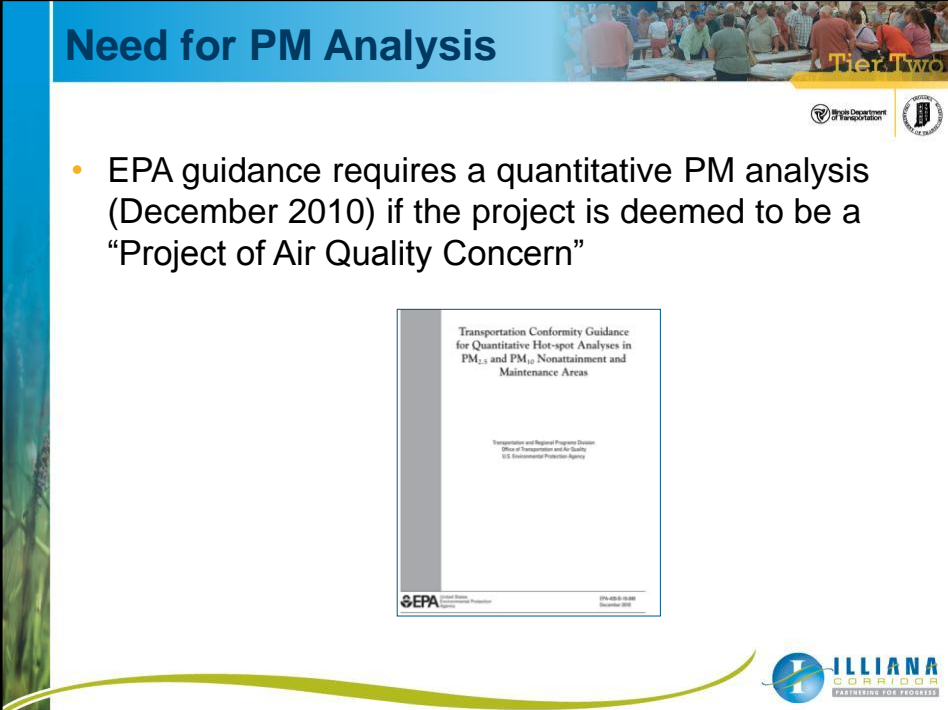

Tier Two

## Need for PM Analysis

Tier Two

- EPA guidance requires a quantitative PM analysis (December 2010) if the project is deemed to be a “Project of Air Quality Concern”

Transportation Conformity Guidance  
for Quantitative Hot-spot Analyses in  
PM<sub>2.5</sub> and PM<sub>10</sub> Nonattainment and  
Maintenance Areas

Transportation and Regional Programs Division  
Office of Transportation and Air Quality  
U.S. Environmental Protection Agency

 EPA United States Environmental Protection Agency

OTPA-400-01-000  
December 2010

## Project Location

Tier Two

- The project traverses Will County, Illinois and Lake County, Indiana

## Need for PM Analysis

Tier Two

- Will County is nonattainment for annual  $PM_{2.5}$
- Lake County is maintenance for annual  $PM_{2.5}$
- Significant increase of diesel trucks anticipated

Table 5-1. Preliminary Projected 2040 Bi-Directional ADT<sup>1</sup>

Alternative B3 Section	Projected 2040 ADT		
	Passenger Car	Truck	Total
I-55 to IL 53	22,400	6,600	29,000
IL 53 to Wilton-Center Road	12,900	6,300	19,200
Wilton-Center Road to US 45	16,200	8,000	24,200
US 45 to I-57	11,600	8,100	19,700
I-57 to IL 50	17,800	7,700	25,500
IL 50 to IL 1	11,300	7,300	18,600
IL 1 to US 41	9,800	7,600	17,400
US 41 to SR 55	9,200	7,400	16,600
SR 55 to I-65	11,600	7,300	18,900

<sup>1</sup> These travel demand projections are considered preliminary and subject to refinement based on additional modeling to be performed based on continuing analysis of interchange locations and types, and road closure determinations.

## Need for PM Analysis

Tier Two

- Classified as a "Project of Air Quality Concern" by Tier II Consultation Group on 2/14/13.

## Analysis Approach

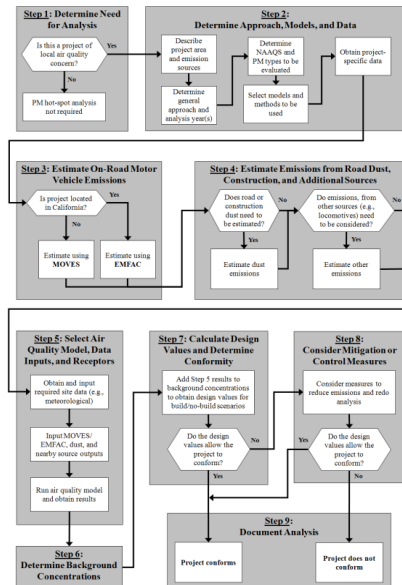

Tier Two

## Overview of PM Quantitative Hot-spot Analysis

Tier Two

## Analysis Approach

Tier Two

- The analysis will be performed for the year of highest expected emissions (No Build & Build). Currently we are determining if that will be the project's opening year (2018) or the project's design year (2040).
- The analysis will include only directly emitted PM<sub>2.5</sub> emissions. Re-entrained road dust will not be included because the SIPs do not identify that such emissions are a significant contributor to the PM<sub>2.5</sub> air quality in the study areas.
- The analysis will use the latest version of EPA's MOVES emissions model (MOVES2010b)
- MOVES input files have been obtained from CMAP and NIRPC

# Modeling

Tier Two

# Modeling

Tier Two

- USEPA's MOVES emissions model will be run for four time periods – A.M. peak, P.M. peak, midday and off-peak

Name	Description	From	To	# of Hours	Time period
Period 1	Overnight	8:00 PM	6:00 AM	10	Off peak
Period 2	Pre- AM Shoulder	6:00 AM	7:00 AM	1	AM peak
Period 3	AM Peak	7:00 AM	9:00 AM	2	AM peak
Period 4	Post- AM Shoulder	9:00 AM	10:00 AM	1	AM peak
Period 5	Midday	10:00 AM	2:00 PM	4	Midday
Period 6	Pre- PM Shoulder	2:00 PM	4:00 PM	2	Midday
Period 7	PM Peak	4:00 PM	6:00 PM	2	PM peak
Period 8	Post- PM Shoulder	6:00 PM	8:00 PM	2	PM peak

## Modeling

Tier Two

- MOVES will be run for four different months – January, April, July and October – to account for different climate conditions throughout the year
- For every link, 16 emissions factors (4 time periods \* 4 seasons) will be developed

## Modeling

Tier Two

- USEPA's CAL3QHCR air dispersion model will be used to estimate concentrations of  $PM_{2.5}$
- CAL3QHCR uses traffic data, emission factor data, and meteorological data to estimate ground-level concentrations of  $PM_{2.5}$  at a series of receptors
- Link-specific inputs include length, mixing zone width, hourly volume, and emission factor

## Modeling

Tier Two

- Five consecutive years of meteorological data will be used for the dispersion modeling analysis; CAL3QHCR does not distinguish between emissions changes due to seasonal differences
- Therefore, each season will be run separately, for a total of 20 model runs per scenario (5 years of met data \* 4 time periods)

## Modeling

Tier Two

- Receptors will be placed in order to estimate the highest concentrations of  $PM_{2.5}$  using a grid pattern.

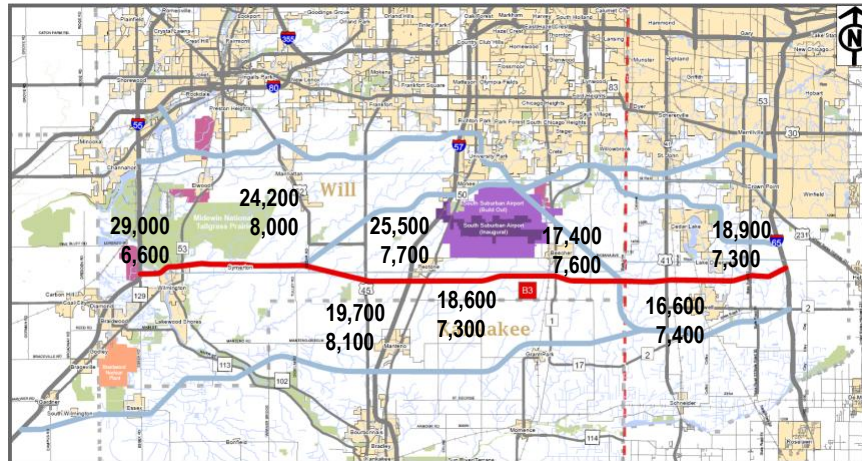

## Site Selection

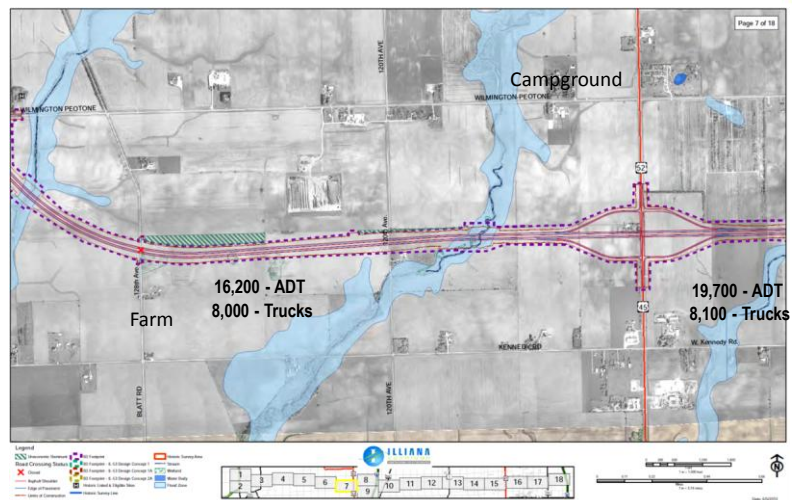

Tier Two

### Tolled Volumes

## Possible Analysis Sites – Wilton Center to US 45 (2<sup>nd</sup> highest truck volume)

Tier Two

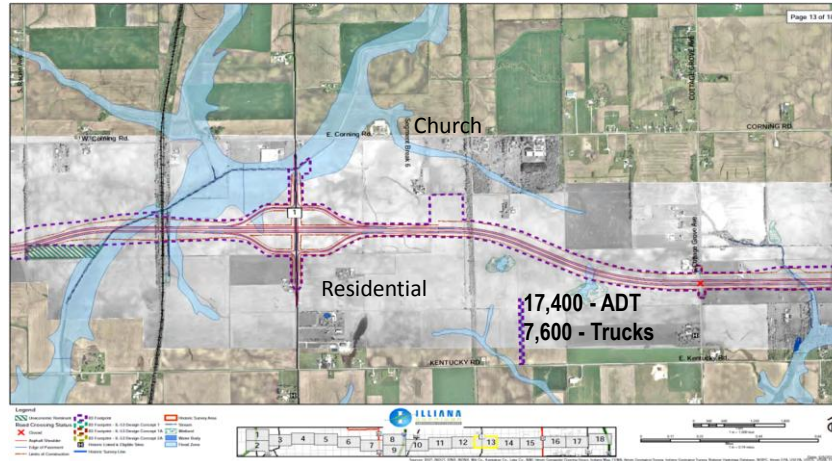

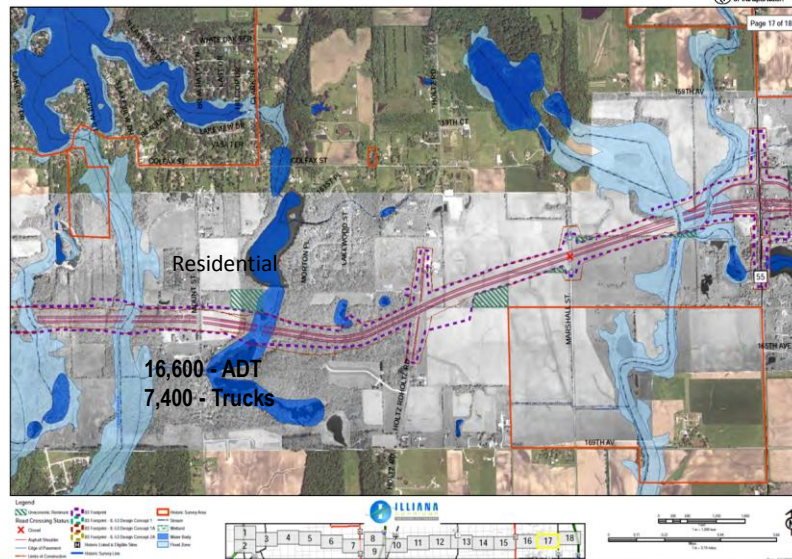

## Possible Analysis Sites – IL 1 to US 41 (4<sup>th</sup> highest truck volume)

Tier Two

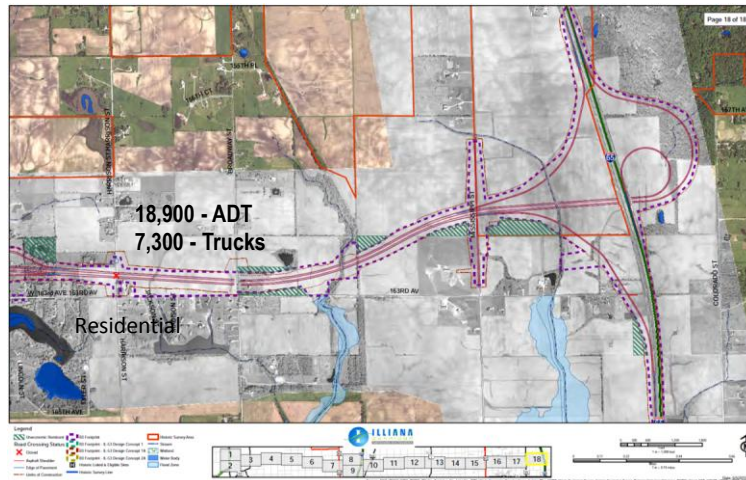

## Possible Analysis Sites – US 41 to SR 55 (5<sup>th</sup> highest truck volume)

Tier Two

## Possible Analysis Sites – SR 55 to I-65 (6<sup>th</sup> highest truck volume)

Tier Two

## Analysis

Tier Two

- Based on the location of sensitive receptors and truck volumes, we are recommending the following three locations undergo a detailed analysis:
  - US 45 to I-57** – Highest truck volumes, nearby residential, new interchange and farm nearby – will also encompass 3rd highest truck volume site (I-57 to IL 50).
  - IL 1 to US 41** – 4<sup>th</sup> highest truck volumes, crosses both states, new interchange, has nearby sensitive receptors.
  - 3<sup>rd</sup> location** – choice between either of the termini:
    - I-55 to IL 53** – has the highest overall ADT and sensitive receptors nearby such as Midewin Tallgrass Prairie – 8<sup>th</sup> highest truck volumes, but 1<sup>st</sup> highest total traffic
    - SR 55 to I-65** – nearby sensitive receptors – 6<sup>th</sup> highest truck volumes, 6<sup>th</sup> highest total traffic.

## Results

- Data from  $PM_{2.5}$  monitors in the project vicinity will be evaluated for the most representative (closest) and most conservative (highest) background values
- Once selected and confirmed through interagency consultation, the background value(s) will be added to the CAL3QHCR modeled design values for comparison to the NAAQS

## Results

Tier Two

- The annual  $PM_{2.5}$  design value is currently defined as the average of three consecutive years' annual averages, each estimated using equally-weighted quarterly averages
- The NAAQS is met when the three-year average concentration is less than or equal to the annual  $PM_{2.5}$  NAAQS (currently  $12.0 \mu g/m^3$ )
- If the design value in the build scenario is less than or equal to the relevant PM NAAQS at appropriate receptors, then the project meets conformity requirements

## Mitigation

Tier Two

## Mitigation

Tier Two

- If the project does not meet conformity requirements, mitigation or control measures to reduce emissions in the project area may be considered
- These include retrofitting and replacing vehicles, cleaner fuels, reducing idling, redesigning the project, and controlling fugitive dust and other emission sources

## Documentation

Tier Two

## Documentation

- The PM hotspot analysis and results will be documented in an Air Quality Technical Report
- Due to the large volume of input and output files created for this analysis, they will be available electronically upon request
